## 1. Introduction

The concept of "molecular hybridization" in drug design aims primarily to combat drug resistance and to enrich existing arsenals of anti-infective agents. ${ }^{1,2}$ It usually involves the combination of two or more pharmacophores or chemical entities either linked with one another or fused together to create a new molecule. ${ }^{3}$ The selection of the pharmacophores is based upon their known bioprofiles, with the hope that the resulting hybrid molecules may exhibit synergistic or additive pharmacological activities. ${ }^{4,5}$ The development of efficient synthetic strategies to access such molecules is therefore warranted.

Chalcones are versatile molecular scaffolds in nature and the laboratory, exhibiting numerous beneficial biological activities such as cytotoxicity to pathogenic organisms ${ }^{6-10}$ and cancer cells, ${ }^{11}$ anti-inflammatory properties, ${ }^{12}$ inhibition of key enzymes, ${ }^{13}$ and antioxidant behavior. ${ }^{14,15}$ Of particular interest to us is the antitubercular activity of natural and synthetic chalcones, via inhibition of FAS-II pathway enzymes such as enoyl-ACP-reductase, $\beta$-ketoacyl-ACP reductase and $\beta$ -hydroxyacyl-ACP-dehydratase ( $\mathrm{ACP}=$ acyl carrier protein). ${ }^{4}$ We sought to augment the activity of chalcones against FAS-II enzymes by pairing them with other pharmacophores, including 1,2,3-triazoles (which have been used in potent anti-TB compounds ${ }^{16,17}$ via blocking the biosynthesis of certain bacterial lipids), flavanones (which exhibit a wide range of relevant biological activities ${ }^{18-23}$ ), and aminopyrimidines (important as inhibitors of different types of kinases ${ }^{24-26}$ among many other effects ${ }^{27-29}$ ). Very recently we have shown a 2 -aminopyrimidine
derivative to possess potent antitubercular activity. ${ }^{30}$ Furthermore, a comparison of the antitubercular activity of triazolylmethoxy chalcones with their cyclic counterparts, the flavanones, was of interest. Figure 1 shows the approach to a small library of the above motifs starting from a common 4propargyloxy acetophenone precursor. No sophisticated instrumentation, conditions, or reagents are required for the transformations, all of which take place under mild conditions.

Figure 1: Preparation of three different prototypes from a common scaffold 2-hydroxy-4-propynyloxy acetophenone.

The resulting triazolylmethoxy chalcones and flavanones were screened for their antitubercular activity via FasII pathway inhibition while triazolylmethoxy aminopyrimidines were evaluated for mycobacterial serine-threonine protein kinase (STPK) inhibitory activity followed by in vitro evaluation against M. tuberculosis $\mathrm{H}_{37} \mathrm{Rv}$.

## 2. Results and discussion

### 2.1 Chemistry:

The intermediate 2-hydroxy 4-propynyloxy acetophenone (1) was prepared by the reaction of 2,4-dihydroxy acetophenone (A) with propargyl bromide, in the presence of anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}$ and tetrabutylammonium bromide ( $20 \mathrm{~mol} \%$ ) in acetone at ambient temperature as recently reported by $\mathrm{us}^{31}$ in quantitative yield. $2-$ Hydroxy-4-propynyloxy acotophenone (1) was elaborated with azides (B) $\{1-3\}$ and aromatic aldehydes (C) $\{1-8\}$ in standard transformations to give triazoles $2\{1-3\}$ and triazolylmethoxy chalcones 4\{1-20\}. The "click reaction" of 2-hydroxy 4 propynyloxy acetophenone (1) with appropriate azides viz $n$ hexyl azide, benzyl azide and 4-bromobenzyl azide $\mathbf{A}\{1-3\}$ at ambient temperature in presence of $\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mol} \%)$ and sodium-L-ascorbate ( $5 \mathrm{~mol} \%$ ) in a mixture of $1: 1$ tert- BuOH : $\mathrm{H}_{2} \mathrm{O}$, led to the formation of respective triazolylmethoxy acetophenones 2\{1-3\} regioselectively in very good yields (Scheme 1). The presence of the group 1,2,3-triazole was indicated by a singlet in the ${ }^{1} \mathrm{H}$ NMR spectra at approximately 7.6 ppm , and signals for triazolyl C-4 and C-5 at approximately 143 and 132 ppm , respectively, in ${ }^{13} \mathrm{C}$ NMR. ${ }^{16,31}$

### 2.1.1. Synthesis of triazolylmethoxy chalcones

There are two possible routes to prepare triazolylmethoxy chalcones, In our experiments with route (a), reaction of propynyloxy acetophenone (1) with aromatic aldehydes followed by click reaction of the preformed 1-(2-hydroxy-4-(propynyloxy) aryl)-3-phenylpropen-1-one $\mathbf{3}\{1-2\}$ with $n$-hexyl azide $\mathbf{B}\{1\}$ gave triazolylmethoxy chalcone $\mathbf{4}\{1\}$ in $73 \%$ and $\mathbf{4}\{2\}$ in $71 \%$ yields along with several minor products which could not be isolated and characterized (Scheme 2). With route (b) ClaisenSchmidt condensation of 1-(4-((1-hexyl-1H-1,2,3-triazole-4-yl) methoxy)-2-hydroxyphenyl) ethanone $\mathbf{2}\{1\}$ with the benzaldehyde $\mathbf{C}\{1\}$ in presence of $10 \%$ aqueous KOH in ethanol at $30^{\circ} \mathrm{C}$ followed by acidification with cold 3 N HCl led to the formation of respective triazolylmethoxy chalcone $\mathbf{4}\{1\}$ in $91 \%$ isolated yield. No side products were observed during reaction.

Scheme 1: Preparation of 2-hydroxy-4-(1-araalkyl/alkyl -1H-1,2,3-triazol-4-yl)-methoxy acetophenone

2,4-dihydroxy acetophenone

Similarly, triazolylmethoxy acetophenones 2\{2-3\} were condensed with electron rich and electron deficient aromatic aldehydes $\mathbf{C}\{1-8\}$ under the above conditions for different intervals of time to give the respective triazolylmethoxy chalcones 4\{2-20\} in good yields (Scheme 3,Table 1).

Scheme 3: Synthesis of 1-[2-hydroxy-4-(1-araalkyl/alkyl-1H-1,2,3-triazol-4-yl)-methoxyl phenyl]-3-phenylprop-2-en-1-one.

The trans- $(E)$ geometry of the chalcone double bond was evident by the large olefinic coupling constant between the relevant signals in the ${ }^{1} \mathrm{H}$ NMR spectrum $(J \approx 15 \mathrm{~Hz})$. Details of these synthetic methods and spectroscopic data are given in Supporting Information.

### 2.1.2. Synthesis of triazolylmethoxy flavanone

The reaction of the above selected triazolylmethoxy chalcones $\mathbf{4}\{1\}, \mathbf{4}\{2\}, \mathbf{4}\{5\}, \mathbf{4}\{6\}, \mathbf{4}\{9\}, \mathbf{4}\{10\}, \mathbf{4}\{13\}, \mathbf{4}\{16\}, \mathbf{4}\{17\}$ and $\mathbf{4}\{19\}$ separately with sodium acetate in ethanol and water (1:1) at $70-80^{\circ} \mathrm{C}$ for different time intervals gave the respective triazolylmethoxy phenyl chromanone $5\{1-10\}$ in good yields (Scheme 4). The effect of substituents on yields of the products $5\{1-10\}$ is dependent on the nature of substitution in aryl ring at $\mathrm{C}-3$ in the chalcone. In general, presence of electron releasing group $\mathbf{4}\{5,6,13$ and 19$\}$ in aryl ring enhanced the yield of products $\mathbf{5}\{3,4,7$ and 10$\}$ whereas presence of electron deficient groups $\mathbf{4}\{2,10$ and 17$\}$ decreased the yield of corresponding flavanones $\mathbf{5}\{2,6$ and 9$\}$ as compared to unsubstituted $\mathbf{4}\{1,9$, and 16\} aryl ring (Table 2). Structures of these flavanones were established on the basis of their spectroscopic data and microanalyses. The characteristic benzylic protons (OCH) of the dihydrochromanone moiety were visible as $d d$ at around $\delta 5.4$ with with $J_{1} \approx 3.0 \mathrm{~Hz}$ and $J_{2} \approx 13.0 \mathrm{~Hz}$; while the two methylene protons of the same were observed as $d d$ at two different field strengths at round $\delta 3.0\left(J_{1} \approx 13.0 \mathrm{~Hz}\right.$ and $\left.J_{2} \approx 17.0 \mathrm{~Hz}\right)$, and at $\delta$ $2.87\left(J_{1} \approx 3.0 \mathrm{~Hz}\right.$ and $\left.J_{2} \approx 17.0 \mathrm{~Hz}\right)$ respectively. The other proton and carbon signals were observed as usual.

### 2.1.3. Synthesis of triazolylmethoxy aminopyrimidines:

The triazolylmethoxy aminopyrimidines $\mathbf{6}\{1-17\}$ were prepared in a simple and straight forward manner by the reaction of their corresponding triazolylmethoxy chalcones $\mathbf{4}\{1\}, \mathbf{4}\{3-13\}, \mathbf{4}\{15-$ $17\}$ and $4\{19-20\}$ with guanidine hydrochloride in presence of NaH in anhydrous DMF as a solvent in moderate to good yields (Scheme 5). It was observed that aromatic substitutents in the chalcones do not have any substantial effect on the yields of the resulting 2-aminopyrimidines (Table 3).

Scheme 5: Synthesis of 2-(2-amino-6-phenylpyrimidine-4-yl)-5-(1-araalkyl/alkyl-1H-1,2,3-triazol-4-yl)-methoxy phenol.

Table 3: Synthesized triazolylmethoxy aminopyrimidines

| Compound | R | Ar | mp $\left({ }^{\circ} \mathbf{C}\right)$ | Yield <br> $(\%)$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{6}\{1\}$ | n-hexyl | Phenyl | $155-156$ | 55 |
| $\mathbf{6}\{2\}$ | n-hexyl | 4-Cl-phenyl | $192-194$ | 54 |
| $\mathbf{6}\{3\}$ | n-hexyl | 2-Cl,6-F-phenyl | $185-187$ | 51 |

| $\mathbf{6}\{5\}$ | n-hexyl | 4-Isopropyl phenyl | $164-166$ | 59 |
| $\mathbf{6}\{6\}$ | n-hexyl | 4-Propargyloxyphenyl | $172-175$ | 49 |
| $\mathbf{6}\{7\}$ | n-hexyl | Naphthyl | $178-180$ | 56 |
| $\mathbf{6}\{8\}$ | benzyl | Phenyl | $185-187$ | 54 |
| $\mathbf{6}\{9\}$ | benzyl | 4-Cl-phenyl | $200-202$ | 51 |
| $\mathbf{6}\{10\}$ | benzyl | 2-Cl,6-F-phenyl | $>200$ | 48 |
| $\mathbf{6}\{11\}$ | benzyl | 4-OCH 3 -phenyl | $180-182$ | 52 |
| $\mathbf{6}\{12\}$ | benzyl | 4-Isopropyl phenyl | $178-180$ | 54 |
| $\mathbf{6}\{13\}$ | benzyl | Naphthyl | $196-198$ | 49 |
| $\mathbf{6}\{14\}$ | 4-Br-benzyl | Phenyl | $190-193$ | 60 |
| $\mathbf{6}\{15\}$ | 4-Br-benzyl | 4-Br-phenyl | $210-213$ | 59 |
| $\mathbf{6}\{16\}$ | 4-Br-benzyl | 4-Isopropyl phenyl | $183-185$ | 56 |
| $\mathbf{6}\{17\}$ | 4-Br-benzyl | Naphthyl | $188-190$ | 51 |

All these compounds were characterized on the basis of their spectroscopic (IR, ESI-MS, ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR) data and microanalyses. In general, the IR spectra of the compounds exhibited characteristic strong absorbance in the range of 3490$3200 \mathrm{~cm}^{-1}$ for the $-\mathrm{NH}_{2}$ group. In the ${ }^{1} \mathrm{H}$ NMR spectra of these compounds a singlet at around $\delta 7.80$ accounted the triazolyl proton while the two exchangeable $\mathrm{NH}_{2}$ protons were observed at around $\delta 6.20$.

### 2.2. BIOLOGY

### 2.2.1. FAS-II inhibitory activity of triazolyl methoxy chalcones and flavanones

FAS-II inhibitory activity was analyzed using a recombinant nonpathogenic mycobacterial strain, Mycobacterium aurum, which contains the M. tuberculosis $\mathrm{H}_{37} \mathrm{Rv}$ kas operon promoter in fusion with an E. coli lacZ reporter gene. ${ }^{32,33}$ The recombinant strain shows continued expression of the reporter gene under the
influence of the kas operon promoter during basal conditions, but the promoter responds to the inhibition of FAS-II pathway by inducing the additional quantifiable expression of the reporter gene. The inducibility rendered by the promoter is pathway specific and is not singularly dependent on the selective inhibition of a candidate gene product. Notably, the FAS-II pathway in mycobacteria is inhibited by isoniazid (INH), ethionamide (ETH) and thiolactomycin (TLM). INH and ETH target inhA while TLM targets KasA, but all three drugs were shown to induce the reporter gene expression by virtue of their inhibition of the FAS-II pathway. ${ }^{32}$

[^0]Therefore, this screening system allows for the identification of compounds that inhibit the mycobacterial FAS-II pathway at any of several points. The cytotoxicity of the potent compounds was determined according to method reported by O'Brien et al with a slight modification.
In the present study, preliminary screening with triazolylmethoxy chalcones and flavanones was performed to score the inhibition of bacterial growth by measuring the decline in colony forming units (cfu) at different concentrations of drugs (Table 4, Fig 2B).

Figure 2: Reporter gene expression and viability assay after treatment with the indicated compounds. (A) Induced levels of $\beta$-gal activity in treated samples of recombinant strain M. aurum- kaspr:lac $Z$ with respect to untreated control. INH as a positive control shows maximum inducibility. (B) Induced levels of $\beta$-gal activity in treated samples of recombinant M. aurum strain with hsp60 promoter, M. aurum-hsp60pr:lacZ, showing a decline in $\beta$-gal activity in all cases, including INH, with respect to untreated control. Both recombinant strains exhibit similar declines in overall viability; greater inhibition is observed with increasing concentration of compounds.

As shown in Table 4, eleven compounds showed $\geq 50 \%$ inhibition of recombinant $M$. aurum growth at $50 \mu \mathrm{M}$. These compounds were assessed by the $\beta$-gal enzyme assay to monitor the inducibility under treated conditions. Enhanced level of $\beta$-gal enzyme activity was observed after treatment with seven of these compounds, $[\mathbf{4}\{4\}, \mathbf{4}\{9\}, \mathbf{4}\{16\}, \mathbf{4}\{18\}, \mathbf{5}\{2\}, \mathbf{5}\{3\}$ and $\mathbf{5}\{7\}]$ with respect to the untreated control, with the response somewhat greater at higher concentration ( $100 \mu \mathrm{M}$ ) (Fig. 2A). This enhanced reporter gene activity is indicative of FAS-II pathway inhibition, which is sensed by the kas promoter. Conversely, when the same experiment was performed using another $M$. aurum recombinant strain carrying the hsp60 promoter, no reporter gene inducibility was observed under similar conditions (Fig. 2A). The $h s p 60$ promoter is nonresponsive to inhibition of the FAS-II pathway ${ }^{33}$ and the decline in reporter gene activity in the treated samples is in line with the diminishing viability of
bacterial cells as the treatment dose increased. Isoniazid (INH), a known FAS-II pathway inhibitor was used as a positive control in both conditions. Four compounds [2\{1\}, 2\{3\}, 4\{2\}, 5\{9\}] which inhibited the bacterial growth did not show enhanced levels of $\beta$-gal enzyme in comparison to the untreated control (Fig. 2A), suggesting activity by a pathway other than FAS-II inhibition. Although the inhibitory concentrations used here are high, these tests provide lead structures with a potential unique mechanism of action that can be considered for further development into more potent antitubercular compounds.

Analysis of structure-activity correlations of these molecules shows that triazolylmethoxy acetophenones having an $n$-hexyl group as the triazol-1-yl substitutent exhibited greater growth inhibition of recombinant $M$. aurum than those with benzyl or 4bromobenzyl groups. The presence of more than one halogen $(\mathrm{Cl}$ and F ) in the flavanone $\mathrm{C}-2$ aryl ring also appeared to impart better activity (compounds $\mathbf{4}\{4\}, \mathbf{4}\{11\}$ and $\mathbf{4}\{18\}$ ) than the other substituents. No other general trends could be discerned.
with respect to other substituents. In general, the growth inhibitory activity and $\beta$-gal inducing power of the flavanones 5 were better than their precursor chalcones. The triazolylmethoxy acetophenones 2\{2-3\} were found to inhibit bacterial growth without inhibiting the FAS-II pathway, whereas their corresponding chalcones and flavanones showed more potent FAS-II pathway inhibition. This suggests that the pharmacophore hybridization concept may be quite fruitful in antitubercular development.

### 2.2.2. Screening of compounds against kinase activity:

Serine/threonine protein kinases (STPKs) have been shown to be important virulence factors in various pathogenic bacteria. Reversible protein phosphorylation by these STPKs plays a key role in regulating many cellular processes including stress response, regulation of cell cycle, and development. This regulatory phenomenon is unambiguously preserved during the course of evolution in all forms of life. The genome sequence of Mycobacterium tuberculosis $\mathrm{H}_{37} \mathrm{Rv}$ revealed the presence of 11 STPKs. Some of these kinases have been implicated in the pathogenesis and survival of the tubercle bacillus within host, particularly PknA, PknB and PknG (Pkn = mycobacterial serinethreonine protein kinase). The last is of particular interest, since its structure contains inhibitor-binding pocket that is not present in any human kinase. ${ }^{34}$ The compound AX20017 specifically binds to this region of PknG, and is therefore a useful tool for comparison to new candidates in screens for active compounds. ${ }^{34,35}$ The compounds prepared above were therefore also screened as inhibitors of the enzymatic activity of purified PknG with myelin basic protein (MBP) as a substrate ${ }^{36}$ using AX20017 as positive control (Figure 3).
PknG enzymatic activity was determined by quantification of the ADP generated by the kinase using the ADP-Glo luciferase reporter kit (Promega, USA). The triazolylmethoxy acetophenones and chalcones proved to be inactive, but aminopyrimidine derivatives $\mathbf{6}\{2\}, \mathbf{6}\{8\}, \mathbf{6}\{9\}, \mathbf{6}\{11\}, \mathbf{6}\{13\}$, $\mathbf{6}\{14\}$ and $\mathbf{6}\{17\}$ showed respectively $43 \%, 29 \%, 53 \%, 43 \%$, $35 \%$, $41 \%$ and $34 \%$ inhibition against (STPK), while the standard inhibitor AX20017 (41\%) at $100 \mu \mathrm{~m}$. (Table 5) However, only the aminopyrimidine $\mathbf{6}\{1\}$ was able to inhibit the growth of M. tuberculosis H 37 Rv ( $\mathrm{MIC}=50 \mu \mathrm{~g} / \mathrm{mL}$ ), suggesting that the level of PknG inhibition exhibited by the other compounds was insufficient, or that they could not reach the enzyme in the organism.
A careful SAR of these aminopyrimidine reveals that the compounds $\mathbf{6}\{1\}$ and $\mathbf{6}\{2\}$ having $n$-hexyl as triazolyl ring
subtituent and phenyl/ 4-Cl- phenyl as 6 -aryl substituent were found to be moderate activity against mycobacterial PknG. Other compound $\mathbf{6}\{8\}, \mathbf{6}\{9\}, \mathbf{6}\{11\}, \mathbf{6}\{13\}, \mathbf{6}\{14\}$ and $\mathbf{6}\{17\}$ with benzyl group as triazolyl substituent coupled with phenyl, naphthyl and 4-Cl-phenyl as 6 -aryl substituent also displayed only moderate inhibition of the enzyme.

## 3. Conclusion

The FAS-II pathway in mycobacteria is responsible for the elongation of carbon chain length of mycolic acid, and is absent in humans. It is therefore an excellent target for the development of small molecules as new chemotherapeutic agents against tuberculosis. We describe the synthesis of new triazolylmethoxy
hybrid molecules in good yields from a common scaffold using different sets of reactions. Several chalcone and flavanone derivatives showed moderate to good inhibition of the mycobacterial FAS-II pathway. These compounds were ineffective against protein kinase G, another attractive mycobacterial target, but several triazolylmethoxy aminopyrimidines showed moderate anti-PknG activity. Further studies on the application of these methods in the synthesis of biologically relevant compounds are in progress.

## 4. Experimental

4.1. Chemistry Commercially available reagent grade chemicals were purchased from Sigma-Aldrich or Spectrochem Pvt Ltd and were used as received. All reactions were followed by TLC on E. Merck Kieselgel 60 F254, with detection by UV light. Column chromatography was performed on silica gel (60-120 mesh, E. Merck). IR spectra were recorded as thin films or in chloroform with a Perkin-Elmer Spectrum RX-1 (4000-450 $\left.\mathrm{cm}^{-1}\right)$ spectrophotometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Brucker DRX-300 in $\mathrm{CDCl}_{3}$. Chemical shift values are reported in ppm relative to $\mathrm{SiMe}_{4}$ as internal reference and J in hertz. MS were performed using a mass Spectrometer Jeol SX-102 and ESIMS were performed using Quattro II (Micromass). Elemental analyses were performed on a Perkin-Elmer 2400 II elemental analyzer
4.1.1. 4-Propargyloxy-2-hydroxyacetophenone (1): To a stirring mixture of 2,4- dihydroxy acetophenone ( $1 \mathrm{gm}, 6.5$ $\mathrm{mmol})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(1.07 \mathrm{~g}, 1.2 \mathrm{eq})$ in acetone ( 15 mL ), propargyl bromide ( $0.59 \mathrm{~mL}, 6.3 \mathrm{mmol}$ ) was slowly added at ambient temperature. Catalytic amount of TBAB $(0.41 \mathrm{~g}, 20 \mathrm{~mol} \%)$ was added to the reaction mixture and stirred for 6 h . The reaction mixture was extracted with ethylacetate, dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and solvent was evaporated under reduced pressure. Crude product was purified by column of silica gel using 9:1 Hexane-EtOAc as eluent to give compound 1. White solid, m.p. $197^{\circ} \mathrm{C}$, yield $1.11 \mathrm{~g}(89.1 \%)$; IR $v_{\text {max }} \mathrm{cm}^{-1} 3411,2357,1640.6 ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 12.6$ (s, $1 \mathrm{H}, \mathrm{OH}$ ), 7.63 (dd, $J=7.05$ and $2.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}$ ), 6.46-6.43 (m, 2H, - ArH ), $4.71(\mathrm{~d}, J=2.3$ $\left.\mathrm{Hz}, 2 \mathrm{H}, \mathrm{OCH}_{2}\right), 2.55\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.53(\mathrm{~d}, J=2.28 \mathrm{~Hz}, 1 \mathrm{H}$, $\mathrm{C} \equiv \mathrm{C} H)$; MS (ESI+) m/z (M+H): 191.1; Anal. Calcd for $\mathrm{C}_{11} \mathrm{H}_{10} \mathrm{O}_{3}: \mathrm{C}, 69.46$; H, 5.30; Found C, 69.41; H, 5.38.

### 4.1.2. Triazolylmethoxy acetophenones $2\{1-3\}$

4.1.2.1. 1-[4-\{(1-Hexyl-1H-1,2,3-triazol-4-yl)methoxy\}-2hydroxyphenyl]ethanone 2\{1\} A mixture of 2-hydroxy-4propargyloxy acetophenone ( $1 \mathrm{~g}, 5.2 \mathrm{mmol}$ ) and $n$-hexyl azide $(0.66 \mathrm{~g}, 5.2 \mathrm{mmol})$ in $1: 1$ tert $-\mathrm{BuOH}: \mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ was stirred at ambient temperature. A freshly prepared solution ( $500 \mu \mathrm{~L}$ ) of sodium ascorbate ( $0.05 \mathrm{~g}, 0.2 \mathrm{mmol}$ ) in water was added followed by addition of freshly prepared aqueous solution (200 $\mu \mathrm{L})$ of $\mathrm{CuSO}_{4} .5 \mathrm{H}_{2} \mathrm{O}(0.02 \mathrm{~g}, 0.09 \mathrm{mmol})$. This heterogeneous mixture was stirred vigorously for 4 h at room temperature after which the reaction mixture was extracted with ethyl acetate and water. Ethyl acetate layer was dried (anhyd $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ) and evaporated under reduced pressure to give a crude product. This was purified by silica gel $(60-120)$ column chromatography using hexane: EtOAc (1:1) as eluent to give compound 2\{1\} as white solid, m.p. $50-52^{\circ} \mathrm{C}$, yield $1.5 \mathrm{~g}(90 \%)$; IR $v_{\text {max }} \mathrm{cm}^{-1} 3376$, 1640.6, $1365 ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 12.6(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH})$, $7.62(\mathrm{dd}, J=6.09$ and $3.81 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArH}), 7.59(\mathrm{~s}, 1 \mathrm{H}$, triazolyl$\mathrm{CH}), 6.50(\mathrm{dd}, J=5.97, J=2.34 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArH}), 5.21(\mathrm{~s}, 2 \mathrm{H}$, $\left.\mathrm{OCH}_{2}\right), 4.35\left(\mathrm{t}, J=7.23 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 2.54\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}_{3}\right), 1.94-$ 1.89 (t, $J=6.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}$ ), 1.32 (bs, $6 \mathrm{H}, 3 \mathrm{xCH}_{2}$ ), $0.90-0.89$ $\left(\mathrm{m}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 202.1,165.1$,
164.5, 142.9, 132.2, 122.4, 114.28, 107.5, 102.0, 62.1, 50.3, 31.1, 30.2, 26.1, 26.0, 22.4, 13.9; MS (ESI+) m/z (M+H): 318.0; Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{~N}_{3} \mathrm{O}_{3}$ : C, 64.33; H, 7.30; N, 13.24. Found C, 64.9; H, 6.39; N, 13.19.
4.1.2.2. 1-[4-\{(1-Benzyl-1H-1,2,3-triazol-4-yl)methoxy\}-2hydroxyphenyl]ethanone $\mathbf{2}\{2\}$ The reaction of $\mathbf{1}(1 \mathrm{~g}, 5.2 \mathrm{mmol})$ and 4 -bromobenzyl azide ( $0.70 \mathrm{~g}, 5.2 \mathrm{mmol}$ ) as described above gave white solid, $89-92^{\circ} \mathrm{C}$, yield $1.5 \mathrm{~g}(91 \%)$; IR $v_{\text {max }} \mathrm{cm}^{-1} 3382$, 1638. NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 12.63(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}), 7.60(\mathrm{~m}$, $1 \mathrm{H}, \mathrm{ArH}$ ), $7.54(\mathrm{~s}, 1 \mathrm{H}$, triazolyl-CH,), $7.36(\mathrm{~m}, 2 \mathrm{H}$, ArH), 7.26 (m, 2H, ArH), 6.46 (d, J = 6.87, Hz, 2H, ArH), $5.51(\mathrm{~s}, 2 \mathrm{H}$, $\mathrm{OCH}_{2}$ ), $5.15(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NCH} 2), 2.52\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}_{3}\right), \mathrm{MS}(\mathrm{ESI}+) \mathrm{m} / \mathrm{z}$ $(\mathrm{M}+\mathrm{H}): 324.1$; Anal. ### 4.1.6. Triazolylmethoxy aminopyrimidines $\mathbf{6}\{1-17\}$

4.1.6.1. 2-(2-Amino-6-phenylpyrimidin-4-yl)-5-\{(1-hexyl-1H-1,2,3-triazol-4-yl) methoxy\} phenol 6\{1\} A solution of guanidine hydrochloride $(0.13 \mathrm{~g}, 1.35 \mathrm{mmol})$ dissolved in DMF ( 1 mL ) was added into a slurry of $\mathrm{NaH}(0.32 \mathrm{~g}, 1.35 \mathrm{mmol})$ in DMF ( 1 mL ) at $0^{\circ} \mathrm{C}$, followed by the addition of chalcone $\mathbf{4}\{1\}$ $(0.50 \mathrm{~g}, 1.23 \mathrm{mmol})$ in DMF ( 1 mL ). The whole reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for about half an hour and after at $100^{\circ} \mathrm{C}$ until reaction got completed (The reaction progress and completion was monitored by TLC). Reaction mixture was filtered over cellite pad using Ethylacetate as solvent. Organic layer was washed three times with water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuum. The viscous crude mass (sometimes solid) thus obtained was purified by column chromatography using ethylacetate/hexane as eluent in the 3:10 ratio, yellow solid, m.p. $155-156^{\circ} \mathrm{C}$, yield $0.30 \mathrm{~g}(55 \%)$; IR $(\mathrm{KBr}) \mathrm{cm}^{-1}$ : 3416.4,. 3315.0, 2336.2, 1571.1; ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}+$ DMSO-d6) $\delta: 8.03-8.01(\mathrm{~m}, 2 \mathrm{H}, \mathrm{ArH}), 7.80(\mathrm{~s}, 1 \mathrm{H}$, triazolyl $\mathrm{CH}=$ ), $7.76(\mathrm{~s}, 1 \mathrm{H}, \mathrm{ArH}), 7.44-7.36(\mathrm{~m}, 4 \mathrm{H}, \mathrm{ArH}), 6.52-6.50(\mathrm{~m}$, $2 \mathrm{H}, \mathrm{ArH}), 6.24\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NH}_{2}\right), 5.16\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{OCH}_{2}\right), 4.34\left(\mathrm{t}, J_{I}=\right.$ $\left.7.08, J_{2}=7.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 1.87\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.28(\mathrm{bs}, 6 \mathrm{H}$, $3 \mathrm{x}-\mathrm{CH}_{2}$ ), 0.84 (bs, $3 \mathrm{H}, \mathrm{CH}_{3}$ ); ${ }^{13} \mathrm{C}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}+$ DMSO-d 6 ) $\delta: 170.3,167.6,166.6,165.9,147.8,142.4,135.2 .2$, 133.3(2C), 131.9(2C), 128.0, 121.2, 116.1, 111.8, 107.6, 104.6, 66.4, 54.9, 36.6. 35.8, 34.9, 30.8, 27.1, 18.7; MS (ESI+) m/z $(\mathrm{M}+\mathrm{H})$ : 445.0 Anal. ### 4.2. Biological assay

### 4.2.1. Material and method for Fas-II inhibitory screening

4.2.1.1. FAS-II inhibition assay. FAS-II inhibitory activity was assessed using a recombinant non-pathogenic mycobacterial strain, Mycobacterium aurum, which contains M. tuberculosis kas operon promoter in fusion with lacZ reporter gene ${ }^{33}$. The strain shows continued expression of reporter gene under the influence of kas operon promoter during basal conditions, while an increased expression of the reporter gene is noticed only after treatment with FAS-II pathway inhibitors. The preliminary screening of the compounds shows FAS-II inhibitory activity at two different concentrations, 50 and $100 \mu \mathrm{M}$.
4.2.1.2. Bacterial strains and viability assay. The generation of recombinant $M$. aurum strains was described earlier ${ }^{33}$. M. aurum cultures were grown in Sauton's medium supplemented with $0.05 \%$ Tween-80 and kanamycin ( $25 \mu \mathrm{~g} / \mathrm{mL}$ ) and were plated on Nutrient-agar plates with $0.05 \%$ Tween-80 (NAT) supplemented with kanamycin. For post treatment viability assay, M. aurum was grown in Sauton's medium up to $0.6 \mathrm{OD}_{600}$ and the culture was diluted to 0.05 OD with fresh medium. From these diluents, $\sim 1 \times 10^{5}$ cells were inoculated into different tubes containing 5 ml fresh medium and added varying concentration of compounds. The cultures were allowed to grow for 12 h at $37^{\circ} \mathrm{C}$ with continuous shaking at 180 rpm . The treated and untreated cultures were plated on NAT-Km plates using 10 -fold serial dilution to count the number of viable cells. \% inhibition was scored considering the number of bacterial colonies in untreated condition as $100 \%$.
4.2.1.3. Reporter gene expression analysis. Recombinant $M$. aurum strains were grown in Sauton's medium with Kanamycin at $37^{\circ} \mathrm{C}$ to $0.5 \mathrm{OD}_{600}$ after which culture was diluted to $0.04-0.05$ OD with fresh medium. Ten millilitre of diluted culture were distributed to separate tubes, equilibrated for 2 h at $37^{\circ} \mathrm{C}$ and then varying concentrations ( 50 and $100 \mu \mathrm{M}$ ) of compounds were added to different tubes. Following 12 h incubation at $37^{\circ} \mathrm{C}, 5 \mathrm{ml}$ cultures from each tube were pelleted, washed and resuspended in PBS (Phosphate Buffer Saline, pH 7.2), sonicated at $4^{\circ} \mathrm{C}$ and supernatant was collected by centrifugation at 13000 rpm for 10 $\min$ at $4^{0} \mathrm{C}$. Protein contents were quantified using Bradford Assay reagent (Sigma B6916) as per manufacturer protocol. $\beta$ Gal assay was performed from total cellular protein as described earlier ${ }^{1}$. Briefly, same amount of protein were mixed with $200 \mu \mathrm{~L}$ of ONPG $(4 \mathrm{mg} / \mathrm{ml})$ and incubated for 30 min at $37^{\circ} \mathrm{C}$. Reaction was stopped by adding $500 \mu \mathrm{~L}$ of $1 \mathrm{MNa}_{2} \mathrm{CO}_{3}$ and optical density was measured at 410 nm . Experiments were carried out in triplicates for each treatment and $\beta$-galactosidase units were calculated for each set individually. The culture at each point was also plated to confirm the decline in viability of cells after drug treatment. The whole experiment was repeated twice and similar trends in results were obtained. Mean value and standard deviation were calculated and plotted for each set of data.

### 4.2.2. Material and method for PknG inhibitory screening

### 4.2.2.1. Purification of Mycobacterium tuberculosis PKnG

The compounds were screened against the mycobacterial serine threonine protein kinase G (PknG). The recombinantly purified enzyme was used for the study. ${ }^{36}$ Briefly the Mycobacterium tuberculosis (MTB) genomic DNA was used as a template for amplification of $p k n G$ gene by PCR. The gene was cloned in pTriEx4 vector using the primers containing the desired restriction enzyme sites. For expression in E. coli, pknG with HindIII flanking sites was subcloned in pTriEx4 vector. E. coli BL21 (DE3) cells were transformed with pTriEX4-pknG and transformants were grown in LB medium containing ampicillin $(100 \mu \mathrm{~g} / \mathrm{ml})$ at $37^{\circ} \mathrm{C}$, till OD at 600 nm reached 0.6 . IPTG was then added to a final concentration of 0.8 mM and cultures were further grown for an additional 4 h at $37^{\circ} \mathrm{C}$ with shaking. Cells were harvested by centrifugation at $5000 \times \mathrm{g}$ for 15 min and resuspended in binding buffer [Sodium Phosphate $20 \mathrm{mM}(\mathrm{pH}$ 7.4), NaCl 50 mM , Imidazole 5 mM , PMSF 1 mM ] and sonicated on ice for 2 min . After sonication TritonX-100 was added in cell lysate at a final concentration of $1 \%$ before centrifugation at $30000 \times \mathrm{g}$ for 30 min at $4^{\circ} \mathrm{C}$. Supernatant was loaded onto Ni2+NTA column, washed with 60 mM Imidazole and 6 -His-PknG was eluted with 200 mM Imidazole. Affinity purified 6-HisPknG was further purified by size exclusion chromatography using Sephacryl 200 column and AKTA Prime protein purification system (GE healthcare).

### 4.2.2.2. Screening of compounds against Kinase activity:

The compounds were dissolved completely in DMSO. For the determination of primary efficacy, $100 \mu \mathrm{M}$ concentration of each compound was screened using purified PknG as an enzyme and myelin basic protein as a substrate. The activity and the inhibition were determined by using luciferase activity mediated by ATP, by ADP-Glo (Promega, USA). Briefly, ADP-Glo ${ }^{\mathrm{TM}}$ Kinase Assay is a luminescent kinase assay that measures ADP formed from a kinase reaction. ADP is converted into ATP, which is converted into light by Ultra-G10 ${ }^{\text {TM }}$ Luciferase.

### 4.2.3. Cytotoxicity Assay: $\mathbf{C C}_{50}$ Determination

The cytotoxicity assays was performed according to method reported by O'Brien et al ${ }^{37}$ with a slight modification. Macrophages were harvested from subconfluent monolayers. The suspended cells were seeded in 96 -well microplates, at an approximate initial density of $1 \times 10^{6}$ cells per well, in RPMI-1640 medium. Compounds were added at the concentrations from $100 \mu \mathrm{M}$ to $12.5 \mu \mathrm{M}$. Rifampicin was taken as positive control for showing viability at concentrations from $4 \mu \mathrm{~g} / \mathrm{ml}$ to $0.5 \mu \mathrm{~g} / \mathrm{ml}$. 96 -well plates were incubated for 48 h at $5 \% \mathrm{CO}_{2}$ at $37^{\circ} \mathrm{C}$. After 48 h , the resazurin was added and incubated for 4 h . The fluorescence and absorbance were measured in a spectrophotometer at $535 / 590 \mathrm{~nm}$. Cytotoxicity was determined by comparing the resulting fluorescence with the mean fluorescence of the control wells (untreated cells), and was expressed as percentage of cell viability. The $50 \%$ cytotoxic concentration $\left(\mathrm{CC}_{50}\right)$ is defined as the quantity of compound generating $50 \%$ of cell viability, compared to the control. The values of the percentages of cell viability were plotted against the concentrations, and $\mathrm{CC}_{50}$ was determined. Experiments were carried out in triplicates.

## Acknowledgements

Authors thanks UGC, CSIR, and DRDO New Delhi for financial assistance. Namrata and Anindra are thankful to UGC and CSIR

New Delhi for their SRF. We are also thankful to SAIF Division, CDRI for providing the spectral data and microanalyses. It is a CDRI communication no. 152/2012/RPT
